

MONEYBEE

WELCOME

Hey [Client Name],

Thank you for choosing us to work on Moneybee. We are looking forward to starting on 11 September and turning the direction we have discussed into a clear, useful website and the systems behind it.

We will work in stages so the design, content, and technical foundation stay aligned. We will begin with the website shell, set the visual direction with you, and then build the backend around the approved experience.

How we will work

01 Website shell and design

We will establish the public structure first: the homepage, PMS and AIF pages, About and philosophy sections, contact flow, careers page, blog shell, and the shared header, footer, and navigation. This phase gives us a real interface to review and refine together.

02 Backend and working systems

Once the design is set, we will make the backend production-ready. This includes the admin area, editable page content, fact sheets and monthly updates, product content for PMS and AIF, CRM lead capture, career applications, user roles, approvals, and the integration points for email and internal software.

03 Polish, measurement, and SEO

After the core system is working, we will add the finishing work: analytics and event tracking, SEO structure and metadata, blog-ready content foundations, performance checks, compliance-oriented approval steps, and agentic workflows where they are useful for Moneybee's team.

Before we begin

Please send us the email address that should receive admin rights for the project. We will use it for the admin account, project notifications, and access to the shared working space.

- Admin email address and the main day-to-day contact
- Moneybee logo files, brand assets, and any approved copy or fact sheets
- The people who will review content and approve publishing
- Access details or a point of contact for the AWS and internal software work when that migration is ready

We will keep the working channel open for design reviews, content questions, approvals, and updates as the project moves through the agreed timeline. We can start with the website shell while the AWS migration is still in progress, then connect the relevant systems when the access and ownership are confirmed.

Looking forward to getting started with you.

Best,

[Your Name]
